

AMENDMENTS TO THE CLAIMS

1. (Currently amended) A mobile terminal for receiving data through wireless communication channels, the data including main data and accompanying data, the main data having written therein information about the accompanying data, said mobile terminal comprising:

a main data acquisition part for acquiring the main data through a predetermined communication channel,

an individual accompanying data communication channel determination part for determining, from a plurality of communication channels, including at least a packet communication channel and a line switching channel, a communication channel for receiving the accompanying data according to the information written in the acquired main data, and

a communication channel selection part for selecting, from the plurality of communication channels, the communication channel determined by said individual accompanying data communication channel determination part, for receiving the accompanying data.

2. (Previously presented) A mobile terminal as claimed in claim 1, wherein said individual accompanying data communication channel determination part determines the communication channel according to the amount of data in the accompanying data.

3. (Previously presented) A mobile terminal as claimed in claim 1, wherein said individual accompanying data communication channel determination part determines the

Serial No. 09/845,309
Docket No.: NEC-F100/USA
IDE.003

communication channel according to the communication time of the accompanying data.

4. (Previously presented) A mobile terminal as claimed in claim 1, wherein the main data is acquired in a page description language, and the accompanying data comprises various configuration files specified by the page description language.

5. (Previously presented) A mobile terminal as claimed in claim 1, wherein the main data comprises a text body of electronic mail, and the accompanying data comprises a file attached to the electronic mail.

6. (Currently amended) A mobile terminal for sending and receiving data through wireless communication channels, the data including main data and accompanying data, the main data having written therein information about the accompanying data, said mobile terminal comprising:

a main data communication channel selection part for selecting a communication channel for sending and receiving the main data,

an individual accompanying data communication channel determination part for determining, from a plurality of communication channels, including at least a packet communication channel and a line switching channel, a communication channel for communication of the accompanying data according to the information written in the communicated main data, and

an accompanying data communication channel selection part for selecting, from the

Serial No. 09/845,309
Docket No.: NEC-F100/USA
IDE.003

plurality of communication channels, the communication channel determined by said individual accompanying data communication channel determination part.

7. (Previously presented) A mobile terminal as claimed in claim 6, wherein said individual accompanying data communication channel determination part determines the communication channel according to the amount of data in the accompanying data.

8. (Previously presented) A mobile terminal as claimed in claim 6, wherein said individual accompanying data communication channel determination part determines the communication channel according to the communication time of the accompanying data.

9-14. (Canceled)

15. (Currently amended) A method of receiving data through wireless communication channels, the data including main data and accompanying data, the main data having written therein information about the accompanying data, said method comprising:

acquiring the main data through a predetermined communication channel;
selecting, from a plurality of communication channels, including at least a packet communication channel and a line switching channel, a communication channel to receive the accompanying data based on the information written in the acquired main data; and
receiving the accompanying data through the selected communication channel.

Serial No. 09/845,309
Docket No.: NEC-F100/USA
IDE.003

16. (Previously presented) The method of claim 15, wherein the selected communication channel is selected based on the amount of data in the accompanying data.

17. (Previously presented) The method of claim 15, wherein the selected communication channel is selected based on the communication time of the accompanying data.

18. (Currently amended) A method of communicating data through wireless communication channels, the data including main data and accompanying data, the main data having written therein information about the accompanying data, said method comprising:

selecting a main data communication channel for communicating the main data;

communicating the main data through the main data communication channel;

selecting, from a plurality of communication channels, including at least a packet communication channel and a line switching channel, an accompanying data communication channel to communicate the accompanying data based on the information written in the communicated main data; and

communicating the accompanying data through the selected accompanying data communication channel.

19. (Previously presented) The method of claim 18, wherein the accompanying data communication channel is selected based on the amount of data in the accompanying data.

20. (Previously presented) The method of claim 18, wherein the accompanying data

Serial No. 09/845,309
Docket No.: NEC-F100/USA
IDE.003

communication channel is selected based on the communication time of the accompanying data.

21. (New) In a communication system comprising a plurality of wireless communication channels, including at least a packet communication channel and a line switching channel, a method of receiving data through the wireless communication channels, the data including main data and accompanying data, the main data having written therein information about the accompanying data, said method comprising:

acquiring the main data through a predetermined one of the communication channels;
based on the information written in the acquired main data, selecting one of the packet switching channel and the line switching channel to receive the accompanying data; and
receiving the accompanying data through the selected communication channel.

22. (New) In a communication system comprising a plurality of wireless communication channels, including at least a packet communication channel and a line switching channel, a method of communicating data through the wireless communication channels, the data including main data and accompanying data, the main data having written therein information about the accompanying data, said method comprising:

selecting one of the communication channels as a main data communication channel for communicating the main data;
communicating the main data through the main data communication channel;
based on the information written in the communicated main data, selecting one of the

Serial No. 09/845,309
Docket No.: NEC-F100/USA
IDE.003

packet switching channel and the line switching channel as an accompanying data communication channel to communicate the accompanying data; and

communicating the accompanying data through the selected accompanying data communication channel.
